SELF ASSESSMENT

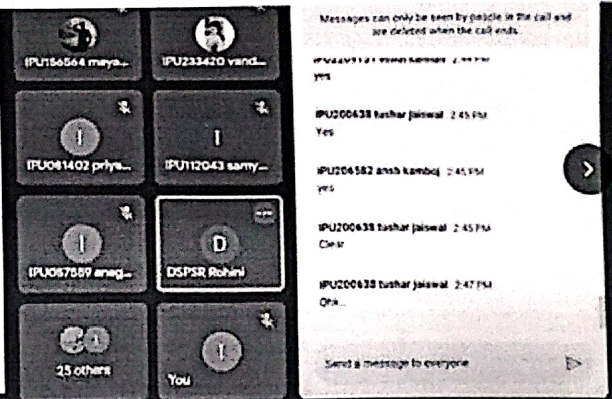

self-assessment is the process of looking at oneself in order to assess aspects that are important to one's identity. It is one of the motives that drive self-evaluation, along with self-verification and self-enhancement. Sedikides (1993) suggests that the self-assessment motive will prompt people to seek information to confirm their uncertain self-concept rather than their certain self-concept and at the same time people use self-assessment to enhance their certainty of their own self-knowledge.¹¹¹¹ However, the self-assessment motive could be seen as quite different from the other two self-evaluation motives. Unlike the other two motives, through self-assessment people are interested in the accuracy of their current self view, rather than improving their self-view. This makes self-assessment the only self-evaluative motive that may cause a person's self-esteem to be damaged.

FUNCTION

If through self-assessing there is a possibility that a person's self concept, or self-esteem is going to be damaged why would this be a motive of self-evaluation, surely it would be better to only self-verify and self-enhance and not to risk damaging self-esteem? Trope in a 1986 paper suggests that self-assessment is a way in which self-esteem can be enhanced in the future. For example, self-assessment may mean that in the short-term self-assessment may cause harm to a person's self concept through realising that they may not have achieved as highly as they may like; however in the long term this may mean that they work harder in order to achieve greater things in the future, and as a result their self-esteem would be enhanced further than where it had been before self-assessment.
